
Step 1: Install Git on Windows

Before you type any commands, your computer needs to understand what "Git" is.

1. Download the free installer from the official website: git-scm.com.
2. Run the downloaded .exe file.
3. Click **Next** through the setup (the default options are perfect for beginners) and click **Install**.

Step 2: Open Your Project Folder

1. Open the regular Windows **File Explorer** and find the folder where your code files are saved.
2. **Right-click** anywhere inside that folder or on the folder itself.
3. Select **Open Git Bash here** (Git Bash is a special command terminal that was installed in Step 1). A black window will pop up.

Step 3: Tell Git Who You Are

Before saving work, Git needs to know your name so it can credit your account. Type these two commands into the black window (press **Enter** after each one):

bash

git config --global user.name "Your GitHub Username"

git config --global user.email "your-github-email@example.com"

Use code with caution.

Step 4: Link Your Local Folder to GitHub

Now, we are going to create a brand new repository on the GitHub website and connect it to your computer.

1. Go to **GitHub.com**, click the **+** icon in the top right, and choose **New repository**.

2. Give it a name, but this time **do not check the "Add a README file" box**. Leave it completely blank.
3. Click **Create repository**.
4. You will see a page with some text. Look for the section that says **"…or push an existing repository from the command line"**.
5. Keep that browser tab open! We will copy those exact commands in the next step.
